on a team that want to learn java but who aren t going to be coding the main java application i e testers managers business analysts front end developers designers etc if you already know java then this book may not be for you this book is aimed at beginners designed to help the reader get started fast the book is easy to follow and has examples related to testing you can find the companion web site for the book at javafortesters.com the book covers just enough to get people writing tests and abstraction layers for example the book cover the basics of inheritance but doesn t really cover interfaces in detail we explain the concept of interfaces because we need to know it to understand collections but not how to write them why because the book covers enough to get you started and working but not overload the reader once you are on your way and have gained some experience you should have the basic knowledge to understand the additional concepts why for testers java developers coding production applications in java need to learn java differently from other people on the team throughout the author s career he has have written thousands of lines of java code but has rarely had to compile the code into an application yet when we learn java from most books one of the first things we learn is javac and the main method and working from the command line and this is confusing most of the code the author writes is wrapped up in a junit test method the author has trained many people to write automation in java and everytime he has taught java to testers or other people on the team we start with a junit test method and run tests from the ide testers and other people on the team use java differently this book provides a different order and approach to learning java you can find the source code for all examples and exercises used in the book over on github github.com/eviltester/javafortesterscode

this second course in the test automation with python series focuses on writing code to automate software testing as opposed to no code tests where you record your actions in an app for later playback writing code for automation gives you more flexibility in many cases such as when a small change to the app causes the testing process to change this course also explains the choice of python as the programming language while java is probably the most popular language used with selenium and appium it can lead to unnecessary complexity and confusion unless you know it well python meanwhile is powerful simple and expressive and in some ways is more flexible in terms of executing ui test automation this course walks you through the entire process from installing python to writing your first script all the way through completion testing and troubleshooting your code note this course was created by headspin university we are pleased to host this training in our library
