Lapland in Color 2007 this is the fourth empidid volume of the series fauna entomologica scandinavica covering the scandinavian species of what is undoubtedly the most difficult palaeartic genus of the family empididae the genus hilara meigen 1822 the format of the present volume is the same as in the preceding three volumes the general part refers only briefly to the morphology of the adults and is followed by sections on the classification life history covering feeding habits epigamic behaviour phenology and a section on zoogeography all these sections are arranged as in the preceding empidid volumes including the zoogeography section in which the scandinavian species are classified into the usual six distributional groups the main part is the systematic treatment which also follows the arrangement of the preceding empidid volumes the key to fennoscandian species includes several additional species which do not receive a separate treatment in the following systematic part

but they are all given a clear diagnosis in the discussion of the most closely related scandinavian species in all 90 species of hilara are treated in the present volume of which 72 have been found to occur in denmark and fennoscandia these further 18 species are included as they may well occur within the area covered by this series although they have not yet been found there

Arctic Bibliography 2015 until now no overview of the quaternary deposits of northeastern europe has been available this book fills the gap it presents the state of research on quaternary stratigraphy and geology with emphasis on glacial deposits discusses the general scientific ideas and gives an overview of the methods of investigation some of which have rarely been applied elsewhere it has become apparent that the region covered has many environmental problems and a proper understanding of the quaternary deposits is a basic requirement for dealing with them the same is true for civil engineering in the formerly glaciated areas almost all construction sites for roads and houses will encounter glacial deposits this volume provides an authoritative and fascinating overview for anyone planning to venture into this field in its 53 regional chapters the book covers finland estonia latvia lithuania russia ukraine belarus poland the czech republic and eastern germany from the text it becomes clear that not all the stratigraphical schemes are yet fully compatible or comprehensible there can be no doubt however that the east was subjected to very extensive ice advances during the earlier pleistocene also in contrast to western europe there was a significant early weichselian ice advance although not as extensive as the last late weichselian event the book is illustrated by 421 figures and 74 colour plates

mostly photographs there are 23 tables a detailed index and a list of over 1000 references providing a unique collection of northeastern european geoscience literature much of which has so far escaped the attention of western scientists the volume composed of contributions by 60 scientists completes the trilogy on glacial deposits of northern europe together with its two companion volumes the glacial deposits in north west europe and the glacial deposits in great britain and ireland it represents an invaluable source of information for the geoscientist the advanced student or the amateur
